# INCOME DISTRIBUTION, AUSTRALIA, 1978-79: INCOME UNITS (PRELIMINARY)

NEW ISSUE

INQUIRIES

If you want to know more about these statistics ring Mr Graham Angus on Canberra (062) 526572 or State offices, or write to Information Services, ABS, P.O. Box 10, Belconnen, A.C.T. 2616

For copies of this publication contact Information Services, Canberra (062) 526627 or State offices.

### MAIN FEATURES

Note. The estimates are subject to sampling variability, as explained in paragraph 18. Standard errors are shown on page 3.

In 1978-79 the estimated numbers of income units (see definition below) and their average annual income were:

	No.	\$
Married couple income units	3,333,800	15,500
One parent income units	218,700	7,320
One person income units	2,773,500	6,590

105,700 (48 per cent) of one parent income units had no earned income.

978,100 (15 per cent of all income units) contained at least one person who had been unemployed at some time during 1978-79.

# **EXPLANATORY NOTES**

#### Introduction

This publication contains preliminary estimates of the income in 1978-79 of several types of income units (defined in paragraphs 4 to 6). The estimates were derived from a survey of annual income which was conducted throughout Australia in the period September to December 1979. Statistics of the income of individuals and unemployed persons were published in Income Distribution, Australia, 1978-79: Individuals (Preliminary) (6501.0) and Unemployed Persons: Income Distribution, Australia, 1978-79 (6521.0) respectively. Further statistics relating to income will be published progressively.

2. The survey was based on a multi-stage area sample of private dwellings (about 15,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covered about one-third of one per cent of the population of Australia.

#### Scope

3. The estimates relate to all persons aged fifteen years and over except: members of the Australian defence forces living in military establishments; certain

diplomatic personnel of overseas governments customarily excluded from census and estimated populations; overseas visitors holidaying in Australia; members of non-Australian defence forces (and their dependants) stationed in Australia; students in boarding schools, patients in hospitals and sanatoria and inmates of gaols, reformatories, etc.

#### **Definitions**

- 4. Married couple income units consist of a husband, wife and dependent children (if any), as defined.
- 5. One parent income units consist of a parent and at least one dependent child; they cannot include a married couple.
- 6. One person income units consist of persons not included in units defined in paragraphs 4 or 5 above. Non-dependent children living with their parents are classed as one-person income units.
- 7. Dependent children are all unmarried persons living with their parent(s) and either under 15 years of age, or full-time students aged 15-20 years whose earned income in 1978-79 was less than \$1,600.
- 8. Total income. Questions were asked in respect of each person aged fifteen years or over, except those attending school full time, on the amount of income received in 1978-79 from each of the following sources: wages or salary; own business, farm, profession, etc. (net income); share in a partnership (net income); government social security and welfare cash benefits; superannuation; interest, dividends, rent, etc.; other sources, e.g. trust or will, maintenance or alimony.
- 9. Income from government social security and welfare cash benefits includes income received through programmes of assistance to aged persons incapacitated and handicapped persons, unemployed and sick persons, veterans and their dependants, widowed and deserted spouses, families and children; cash benefits for education; and other social security and welfare programmes.
- 10. Earned income is income from wages or salary; own business, farm, profession, etc.; share in a partnership; or any combination of these.

- 11. Median income is the amount which divides the distribution into two equal groups, one having incomes above the median and the other having incomes below it. Medians were calculated from grouped data with linear interpolation being used within the class interval in which the median fell.
- 12. *Mean income* is the amount obtained by dividing the total income of a group (e.g. married couple income units) by the number in that group.
- 13. Unemployed persons are those who during any week were not employed (i.e. did not work for pay, profit, commission or payment in kind, and did not have a job, business or farm) and were looking for work.
- 14. Duration of unemployment is the total number of complete weeks in 1978-79 during which a person was unemployed (as above).

#### Interpretation of results

- 15. Since the estimates are based on a sample, they are subject to sampling variability. (See paragraphs 18 to 21 below.) In addition, they are subject to errors of response and reporting. Although some respondents referred to their records, in many cases the answers to the questions on income were based on memory. Some understatement in the estimates may be expected because of imperfect recall or misunderstanding, particularly of minor or irregular sources of income.
- 16. Characteristics of income units, such as marital status of members and composition of the unit (see paragraphs 4 to 6) are recorded as at the time of the interview. Some income units which experienced, between July 1978 and the date of the interview, a major change in their status of the kinds indicated below, were excluded from the tables:
  - (a) income units whose head or spouse had lived outside Australia for more than twelve weeks during 1978-79 and had worked overseas in a job or jobs unrelated to an Australian job or business (e.g. migrants arriving in Australia after September 1978 and Australian residents who worked temporarily overseas),
  - (b) income units whose female head had lived with her husband for more than twelve weeks during 1978-79 but was not doing so at the time of the interview (e.g. females who were widowed or became separated after September 1978) and
  - (c) income units containing a person aged 15 years or over who was at school for more than twelve weeks during 1978-79, but was not at school and not living with parent(s) at the time of the interview.

Income units where the head or spouse was outside the scope of the survey (see paragraph 3) or was a non-respondent were also excluded.

- 17. Other points which should be kept in mind in interpreting the results of this survey are as follows:
  - (a) For the purposes of the survey, total income included all income received while living in Australia (including income received from an overseas source) and all income received from an Australian source while living overseas.
  - (b) The income received by an income unit does not necessarily reflect the standard of living of the unit. For example, although alimony and maintenance payments were counted as income, gifts or donations (such as might be made by relatives) were not included, even though they may have been the sole means of support.
  - (c) The income of an income unit does not include amounts received by persons who were members of the income unit during all or part of the year 1978-79 but no longer resided with the income unit at the time of the interview. Thus, income received during 1978-79 by persons who had died before the interview was not included.
  - (d) Income units receiving no income in 1978-79 have been included in the calculation of mean and median incomes.

#### Reliability of the estimates

- Since the estimates are based on information obtained from occupants of a sample of dwellings they are subject to sampling variability; that is they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. The standard error can also be expressed as a percentage of the estimate, and this is known as the relative standard error.
- 19. Space does not allow for the separate indication of the standard error of all estimates in this publication. Table A shows standard error of estimates of numbers of income units for a range of estimate sizes, while Table B shows relative standard errors of estimates of mean and median income for different numbers of income units. These figures will not give a precise measure of the standard error of a particular estimate, but they will provide an indication of its magnitude.
- 20. Examples of the calculation and use of standard errors are given below:

- (a) From the table it will be seen that the estimate of 200,700 income units whose earned income was between \$15,000 and \$16,000 (Table 3) has a standard error of about 7,200. Therefore there are about two chances in three that the number of income units with earned income in that range would be between 193,500 and 207,900 and about nineteen chances in twenty that it would be between 186,300 and 215,100 if all dwellings had been included in the survey.
- (b) Table 2 shows that the estimated number of one person income units in New South Wales was 1,003,400 and that their estimated mean income was \$6,700. From the table below it will be seen that the relative standard error of the mean income of 1,003,400 income units is about 1.8 per cent. As 1.8 per cent of \$6,700 is about \$121, there are about two chances in three that the mean income would be between \$6,579 and \$6,821 and about nineteen chances in twenty that it would be between \$6,458 and \$6,942.
- 21. As the standard errors in the tables show, the smaller the estimated number of income units the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their

- value for most reasonable uses. In this publication estimates below the levels shown in Table A, and means and medians based on such estimates, have not been included. Although figures for numbers of income units can in some cases be derived by subtraction, they should not be regarded as reliable.
- 22. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may have occurred because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample. See paragraph 15.

#### Related publications

23. Current publications produced by the ABS are listed in *Catalogue of Publications* (1101.0), which is available free of charge from any ABS office.

## Symbols and other usages

- \* Subject to sampling variability too high for most practical uses. See paragraph 21.
- . Not applicable.
- 24. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.
